I-4 Ultimate
What to Expect During I-4 Ultimate Construction
Episode: #2 – “Pile Driving”
May 2015

VIDEO	AUDIO
Suggested on camera anchor/reporter intro	ON CAMERA: There's a lot that goes into building a better I-4. Some of the structures you won't even see above ground.
	Sound Full: Pile driving
	VOICE OVER: This is a sound we will all soon become very familiar with.
	Sound Full: Pile driving
	VOICE OVER: The sound of pile driving. But what is all this pile driving for?
Lower third: Piles support the roadway	Concrete and steel piles are an essential part of the underground structures needed to create the foundations that support the new road, bridges and ramps that will become I-4 Ultimate.
Lower third: About 7,000 piles will be driven	About 7,000 piles will be driven into the soil along the 21 mile project.
Lower third: Most work will happen during the day	So, what about the noise levels? Will that be going on all day and night? No. Most pile driving will take place during the day, but if some needs to be done at night, FDOT engineers will be monitoring noise levels to cause as little disturbance as possible. During day time hours, noise levels will be monitored in school zones during the school's special testing days.

Lower third: FDOT will monitor noise levels Lower third: Piles will be hammered or vibrated in	In some areas, depending on the composition of the soil, FDOT may “vibrate” the piles into the ground rather than “hammering” them. Soft, loose soil would allow for vibratory pile driving. Though less noisy, it still will vibrate the ground, but engineers will be monitoring that also.
